

Red Batch

Governed batch containment

A product-safety complaint becomes a human-approved stop-ship on the exact right orders — a governed UiPath Maestro Case agent with a saved, reopenable record.

Problem statement and proposed solution

Problem

When a safety complaint lands on a lot you might still be shipping, you have minutes, not days. Teams either freeze the whole warehouse — and break shipping for everyone — or chase orders by hand in a spreadsheet while defective units keep going out. There is no fast, governed way to hold exactly the right orders, behind a human sign-off, with proof of what changed.

Solution

Red Batch is a governed containment workspace. The Batch Containment Agent traces the bad lot to its SKU and warehouse and fans out to every Ready-to-Ship order in scope (37 to hold, 11 excluded with a reason each). Nothing changes until a QA manager approves — a real UiPath Action Center task. On approval it quarantines those orders (≈\$360,480 across 3 zones), verifies by reading back (37/37), and saves a reopenable Stop-Ship Packet. Low-confidence signals route to human review.

Benefits and technologies used

End-user	Quality / Safety Ops leads, QA managers, Customer Ops, Auditors
User department	Product Quality & Safety, Warehouse Operations, Compliance
Industries	Consumer Electronics, Manufacturing, Retail & E-commerce, Supply Chain
UiPath products used	UiPath Automation Cloud (Orchestrator) · UiPath Action Center (Actions / OR.Tasks) · UiPath Orchestrator REST API · UiPath External Applications (OAuth)

Benefits, impact and outcomes

- Holds exactly the right orders — 37 held, 11 excluded with a reason each — instead of freezing the whole warehouse.
- Every state change is gated by a real human approval — a live UiPath Action Center task — before anything moves.
- Verifiable outcome: a saved, reopenable Stop-Ship Packet with the before/after diff, evidence, named approver, and exclusions.
- Honest, auditable automation: low-confidence cases route to human review; each step writes a governed run.

Solution architecture

How it works

Risk signal → Batch Containment Agent (observe → map lot/SKU/warehouse → fan-out orders → classify exclusions) → QA approval = live UiPath Action Center task (CreateTask / CompleteTask) → quarantine order state → verify by read-back (37/37) → saved Stop-Ship Packet. Every step writes a governed run + timeline event.

Agent type: Coded Agent (custom TypeScript), governed by UiPath Action Center. Deterministic policy; optional additive LLM narration.

UiPath: Automation Cloud (Orchestrator) · Action Center (OR.Tasks) · Orchestrator API · External Applications (OAuth). App: Next.js · React · TypeScript · D1 / node:sqlite.
